

Points, line and band: Tostevin and Gade, Phys. Rev. C 103, 054610 (2021). The points are read from that figure's own vector operators and tick calibration, and reproduce the two values its text quotes exactly. Error bars not extracted.

Chords: this work, ^{40}Si alone. Two channels, one nucleus, so this is a two-point chord and NOT a fit to the compilation; the other four channels are not computed yet. Each chord is anchored at $\Delta S = 0$, because only its tilt is the claim.
